## Feature Management

Manage flags with GitOps  
experience

Build Feature Flag pipelines

Manage Flag Tech-Debt

The screenshot shows the Harness Feature Flags interface. At the top, there's a header with 'Feature Flags' and a dropdown for 'Environment' set to 'Test'. Below it are buttons for '+ New Flag', 'Portal', and a search bar. On the right, there are checkboxes for 'Git Sync' and 'Auto-commit to the branch'. The main area displays a table for 'FEATURE FLAG' with columns for 'DETAILS', 'STATUS', and 'EVALUATIONS LAST 7 D'. One row is highlighted for 'HarnessFF', which is described as 'This flag is to turn on the FF harness\_ff'. It's a Boolean flag that is 'ACTIVE' and was last evaluated 2mins ago, with 929 evaluations. To the right of the table is a preview card showing a slider and a JSON configuration snippet:

```

featureFlags:
  flags:
    - flag:
        name: HarnessFF
        identifier: harness_ff
        description: "This flag is to turn on the FF harness_ff"
        prevent: false
        spec:
          type: boolean
          default: true
          offVariation: "true"
          onVariation: "false"
        variations:
          - identifier: "true"
            value: "true"
          - identifier: "false"
            value: "false"
  
```

The screenshot shows a dark-themed interface for the Harness AIDA tool. At the top left, it says "AI Infused DevOps". In the top right is a purple flower-like logo. Below the logo, two notifications are displayed: "AIDA is analyzing ..." and "We found 4 possible remediations". A large callout box titled "Harness AIDA Remediation Steps" contains text about preventing SQL injection by using parameterized queries instead of direct insertion. It also includes a code snippet in Python:

```

conn = sqlite3.connect('users.sqlite')
c = conn.cursor()
c.execute("DROP TABLE users")
c.execute("CREATE TABLE users (user text, password text, failures int)")

for u,p in users:
    c.execute("INSERT INTO users (user, password, failures) VALUES (?, ?, ?)", (u, p, 0))
conn.commit()
conn.close()

```

At the bottom of the interface, there are buttons for "Generated just now", "Regenerate", and "Helpful? Yes No".

AI Development Assistant

Leverage AI across the software delivery lifecycle: code, build and test, secure, deploy, manage costs, and ensure resilience.
